Subject: **Transmittal Letter**
Final Phase III Environmental Site Assessment Report
GAF Building Materials Corporation Site
MACTEC Project 3410100795

Dear Mr. Shaw:

MACTEC Engineering and Consulting, Inc. (MACTEC) is pleased to submit one original and six copies of the above referenced Report.

As you know, MACTEC completed a round of groundwater sampling in January 2011 and expects to complete the final round of sampling later next week, at which time the drums of investigation derived waste will be removed. The results of those activities will be submitted to you under separate cover.

MACTEC appreciates the opportunity to be of service to MacDonald Illig Jones & Britton and the Erie County Convention Authority. Please contact me with any questions at (412) 279-6661.

Sincerely,

MACTEC Engineering and Consulting, Inc.

1.0 INTRODUCTION

MACTEC Engineering and Consulting, Inc. (MACTEC) has completed a Phase III Environmental Site Assessment (ESA) at the former GAF Building Materials Manufacturing Corporation, Inc. (GAF) Facility (Site) located at 218 Bayfront Parkway in the City of Erie Pennsylvania (Figure 1). The work described herein was performed for McDonald, Illig, Jones and Britton LLP, on behalf of their client, the Erie County Convention Center Authority (ECCCA). The work was completed in accordance with MACTEC's proposal dated September 9, 2010 and subsequent change orders which were authorized to allow for additional soil borings, groundwater sampling, and disposal of investigation derived waste.

ECCCA acquired the Site from GAF during November 2010. Prior to that time, MACTEC was granted access to the Site pursuant to a written agreement between ECCCA and GAF. When the site was owned by GAF, MACTEC was accompanied by a GAF representative while on the Site.

The overall objective of this Phase III ESA was to collect additional data from the Site to better estimate remedial costs. Specifically, the objectives of the work included delineating the lateral extent of dense, non-aqueous phase liquid (DNAPL) identified in well MW-5 (Figure 2); collecting pre-design geotechnical/environmental data for the anticipated remedial action(s); and preparing a preliminary remedial design sufficient to prepare a cost estimate for implementation of a remedy that achieves an Act 2 Standard. Information relating to preliminary remedial design and potential remedial cost estimates was submitted to McDonald Illig on November 18, 2010 and will, therefore, not be reiterated here.

To meet the objectives, MACTEC performed the following activities at the Site during this phase of work:

1) Completed 21 soil borings and collected four soil samples for analytical and geotechnical analyses;
2) Installed two upper bedrock and three shallow overburden groundwater monitoring wells;
3) Gauged each well to determine the existence of non-aqueous phase liquids (NAPL) and collected groundwater and NAPL samples for laboratory analyses.

The Phase III ESA methods and results are provided in Sections 2.0 and 3.0, respectively.

1.1 SITE DESCRIPTION AND BACKGROUND

The GAF Site is a 12.46-acre property located at 218 West Bayfront Parkway, City of Erie, Erie County, Pennsylvania 16507. The Site is bounded to the north and west by Presque Isle Bay (Bay), to the south by the Bayfront Parkway, and to the east by Sassafras Street, beyond which is the Erie Convention Center (Figure 2).

Between approximately 1903 through 2007, the Site was used for the manufacture of residential and commercial asphalt roofing products. The process utilized tar, crushed stone, ground talc, and paper products as the raw materials. The Site produced rolled roofing material for industrial and commercial applications and roofing shingles for residential applications. Historically, the Site was occupied by buildings, tanks/pipe runs, and roadways associated with manufacturing. However, by the time of this Phase III ESA, GAF had demolished all of the on-site structures, such that all that remains are roadways, floor slabs, and foundations.

As shown on Figure 2, the ground surface at the Site is relatively flat and covered by either asphalt and concrete roadways or the floors of former structures. During the demolition, GAF established grades between the ground surface and the elevated building floors by placing crushed demolition debris at the margins of the buildings. Surface water runoff throughout most of the Site is directed to storm drains. In the northern-most, undeveloped portion of the Site, storm water appears to flow directly to the Bay. An unnamed creek is tubed beneath Sassafras Street along the southern part of the eastern Site boundary. The creek daylights at the approximate mid-point of the eastern boundary and then flows north in an open channel to its discharge at the Bay. During this Phase III ESA, flow in the creek was observed to be intermittent. Site conditions observed during this Phase III ESA are discussed further in Section 3.0.

The northern and western boundaries of the Site consist of relatively steep embankments to the Bay as shown on Figure 2. The embankments and a mound in the northern part of the Site contain large pieces of concrete and rubble and various fill material covered with scrub vegetation.

The majority of the Site where manufacturing occurred is at elevations between 579 and 583 feet above mean sea level (ft-msl) (Figure 2). The roadway where monitoring well MW-5 and boring B-3 are located represent the lowest areas on the site at approximately 579 ft-msl, whereas the mound at the northern end of the site is at approximately 588 ft-msl and the southern end of the Site is at an elevation of approximately 585 ft-msl. The elevation of the bottom open channel portion of the small unnamed

creek that is located at the eastern boundary of the Site is 573 ft-msl. According to records from the National Oceanic and Atmospheric Administration's (NOAA) Erie PA Station ID 9063038 (www.http://tidesandcurrents.noaa.gov), the mean elevation of Lake Erie as measured at that station in November 20101 was 570.52 ft-msl.

The Site has been the subject of numerous environmental site assessments over the years that were conducted for various reasons. Those activities included soil and sediment sampling; sampling of building materials; and the construction and sampling of groundwater monitoring wells MW-1 through MW-9 completed in the shallow unconsolidated aquifer. In general, the relevant results of those activities indicated that:

- Much of the Site is underlain by old roofing materials, some of which contain concentrations of various volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs) associated with tar and tar-like material in concentrations exceeding the PADEP Act 2 Statewide Health Standard Medium-Specific Concentrations (MSCs);

- Viscous, tar-like dense nonaqueous phase liquid (DNAPL) is present in monitoring well MW-5; and

- VOCs and SVOCs associated with petroleum products are present in groundwater in concentrations exceeding PADEP Medium Specific Concentrations (MSCs) in portions of the Site.

The detailed findings from the earlier assessments were used to develop the Phase III ESA scope of work. The Phase III ESA characterization methods are described in Section 2.0 and the results are presented in Section 3.0.

1.2 **LIMITATIONS**

The opinions presented in this report are based on the data obtained by MACTEC and others during completion of this project and were developed using our professional judgment, training, and experience. We believe that these opinions are reasonably supported by the results of the testing and application of professional standards of care that are generally accepted for completion of environmental site

investigations. MACTEC has not undertaken a systematic investigation of every part of the property and has limited its investigation to the scope agreed upon with ECCCD.

This document was prepared for the sole use of McDonald, Illig, Jones and Britton LLP and the ECCCA, the only intended beneficiaries of our work. No other party shall rely on the information contained herein without prior written consent of MACTEC.

2.0 PHASE III CHARACTERIZATION METHODS

This section provides a summary of the methodologies used to conduct the Phase III investigation. The Phase III ESA included drilling soil borings; installing groundwater monitoring wells; and sampling soil, groundwater, and NAPL as described below.

2.1 SOIL BORING AND BEDROCK CORING

Between October 21 and November 9, 2010, MACTEC drilled 21 soil borings, including Borings B-1 through B-18, and monitoring wells MW-3D, MW-4D and MW-10 (Figure 2). Note that borings B-14 and B-18 were ultimately completed as monitoring wells MW-11 and MW-12, respectively. Monitoring well construction is discussed in Section 2.2. Table 1 presents a summary of boring completion information and boring logs are included in Appendix A.

The boring locations were selected to allow for the collection of data related to:

1) Delineation of the occurrence and extent of DNAPL in the vicinity of monitoring well MW-5. Soil borings B-1 through B-5, B-10, B-13, B-15, B-16; and B-17, along with groundwater monitoring wells MW-11 (B-14) and MW-12 (B-18) were completed for this purpose. The original scope of work called for five soil borings and one monitoring well to be completed for this purpose; however, additional borings were authorized based on observations in the field indicating that non-aqueous phase liquids (NAPL) likely extended beyond the originally estimated boundaries.

2) Assessment of soil conditions beneath the southern building slab. Soil borings B-6, B-7 and B-8 were completed for this purpose. The original scope of work directed that these borings only be advanced to approximately 4 to 10 feet below ground surface (ft-bgs) to allow for the collection of shallow soil samples for laboratory analysis. The decision was made in the field to advance borings B-6 and B-8 deeper to obtain additional information related to the elevation of the top of bedrock.

3) Assessment of geotechnical conditions in support of a potential future slurry wall design on-Site. Borings B-9 through B-12 were completed for this purpose, as were MW-10, MW-3D and MW-4D. The original work scope directed that the boring at B-10 was to be completed as a bedrock

monitoring well in the vicinity of existing well MW-2; however, the decision was made in the field to not advance the boring into bedrock due to the observed presence of potential DNAPL in the shallow unconsolidated material.

MACTEC subcontracted Terra Testing of Washington, Pennsylvania to perform all drilling services. Prior to drilling, MACTEC made the required PA One Call notifications and marked the on-Site locations in the field with the GAF representative. At each location, the surface concrete or asphalt was cored or cut and the soft drill (a.k.a. air knife) method was employed to approximately 4 to 5 ft-bgs to minimize the risk of encountering an underground obstruction. Underground pipes were encountered at the initial locations for B-3, B-12, and B-16, as indicated on the boring logs. Soft drill was not performed at locations B-6, B-7, and B-8.

Following the soft drill, 4 ¼ inch ID hollow stem augers were advanced to 4 ft-bgs. Split barrel sampling was then completed in accordance with ASTM methods to refusal at each location except B-7, which was completed shallower in accordance with the work plan. Upon retrieval of each split barrel, the material was screened for VOCs using a photoionization detector (PID) and a description of the material was recorded by the MACTEC geologist in the bound project field book.

Upon completion of each boring, approximately 2 to 3 ft of bentonite hole plug was placed in the bottom of the bore hole, followed by drill cuttings to the surface. At locations where monitoring wells were to be installed, the drill cuttings were placed into labeled 55 gallon drums for subsequent off-site disposal. MACTEC subcontracted the professional land surveying services to Sanford Engineering of Erie, Pennsylvania to survey the horizontal and vertical locations of the soil borings and monitoring wells and prepare the base map used as Figure 2.

2.1.1 Bedrock Coring

Bedrock coring was completed at locations B-9, MW-3D, MW-4D, and MW-10. At those locations, an approximate 2-1/8 inch NX rock corer was advanced 10 feet into bedrock through the hollow stem augers. The core was retrieved and logged by the geologist and placed into boxes for potential future use. Following completion of the borings at MW-3D and MW-4D, bedrock monitoring wells were constructed in the boreholes as described in Section 2.2. Boring B-9 was backfilled with bentonite to approximately 3 feet above the top of bedrock, followed by drill cuttings to the ground surface. At MW-10, bentonite hole plug was placed from the bottom to approximately 1 to 2 feet above the bedrock surface, followed by

typical well construction materials. Drill cuttings from MW-3D, MW-4D, and MW-10 were containerized in 55 gallon drums for subsequent off-site disposal.

2.1.2 Soil Sample Analyses

Soil samples were collected from selected borings for laboratory analyses. The following subsections summarize the soil samples collected during the Phase III investigation.

2.1.2.1 Chemical Analyses

Soil samples were collected from the following locations and submitted to TestAmerica Laboratories in Pittsburgh, Pennsylvania for chemical analysis:

- B-6: 4 to 6 ft-bgs interval;
- B-7 (and B-7 Replicate): 2 to 4 ft-bgs interval;
- B-8: 0 to 2 ft-bgs interval; and
- B-13: 12 to 14 ft-bgs interval.

The samples for chemical analysis were submitted for Target Compound List (TCL) VOCs using SW-846 Method 8260, TCL SVOCs using SW-846 Method 8270, Target Analyte List (TAL) metals using SW-846 Method 6010/7471, and PCBs using SW-846 Method 8082. In addition to those samples, a soil sample was collected from the 7 to 8 ft-bgs interval at B-1 for waste characterization by Toxicity Characteristics Leaching Procedure (TCLP) VOCs by USEPA SW-846 Method 1311/8260, SVOCs by USEPA SW-846 Method 1311/8270, metals by USEPA SW-846 Method 1311/6010 and 7471, ignitability by USEPA SW-846 Method 1020A, reactive cyanide by USEPA SW-846 Method 9012, reactive sulfide by USEPA SW-846 Method 9030, and corrosivity (pH) by USEPA SW-846 Method 9045C. This soil sample was chosen for TCLP testing because it was thought to be representative of material below the water table containing NAPL. A sample of the DNAPL from MW-5 was also submitted to TestAmerica for the waste characterization analysis (petroleum products cannot be extracted by USEPA SW-846 Method 1311 and are analyzed directly for VOCs, SVOCs and metals by USEPA SW-846 Methods 8260, 8270 and 6010/7471, respectively).

Soil samples were collected from the respective depth intervals into appropriate laboratory-supplied containers. Samples were submitted to the laboratory following routine chain of custody procedures. A

laboratory prepared trip blank accompanied each sample shipment containing samples for VOC analysis. Copies of the chain of custody documentation are provided with the final analytical data reports in Appendix B.

2.1.2.2 Geotechnical Testing

MACTEC collected Shelby tube samples from a silty clay layer present immediately above bedrock surface at B-10, B-11, MW-10 and MW-4D for geotechnical testing. The purpose of the testing was to determine if the material would be suitable for keying in a slurry wall if that remedial option were selected. However, because the material was not continuous across the site, it was decided not to complete the laboratory testing. In addition, MACTEC collected approximately 5 gallons of groundwater from well MW-9 for slurry wall compatibility testing. It was also decided not to complete compatibility testing during this phase of the project.

2.2 GROUNDWATER MONITORING WELL INSTALLATION & DEVELOPMENT

During this Phase III ESA, MACTEC installed groundwater monitoring wells MW-3D, MW-4D, MW-10, MW-11, and MW-12. Well completion details are summarized on Table 1 and well completion logs are provided in Appendix A.

Each of the wells was constructed with 2 inch inside diameter (ID) schedule 40 polyvinyl chloride (PVC) casing and screen materials. Wells MW-3D and MW-4D were completed approximately 10 feet into bedrock with 5 foot long screens having 0.020-inch machine slotted screen. Wells MW-10, MW-11, and MW-12 were completed in the unconsolidated overburden with 10 foot long 0.020-inch machine slotted screens that intercept the water table. A sand pack was placed in the annular space around the screen to approximately 1 to 2 feet above the top of the screen. Bentonite chips were placed above the sand to approximately 2 ft-bgs and hydrated. A steel, flush mount protective casing was then placed in concrete at the well head.

The wells were allowed to stabilize for a minimum of 48 hours prior to development. Well development was accomplished by bailing to remove sediment to ensure adequate communication between the well and surrounding formation. Well development continued until at least 10 well volumes had been evacuated. Development water was containerized in labeled 55 gallon drums for subsequent off-Site

disposal. As with the soil borings, Sanford Engineering surveyed the horizontal and vertical location of each well (including the top of PVC casing elevation).

2.3 GROUNDWATER SAMPLING

Groundwater samples were collected from each of the new and existing monitoring wells, except for MW 3D and MW-4D, during November 2010. Samples were collected using the low flow purge technique in which groundwater is evacuated with a peristaltic pump at a rate of less than 100 ml/min through a flow-through cell that continuously analyzes pH, conductivity, temperature and dissolved oxygen. Once those parameters stabilized to within ± 10%, the samples were collected. New tubing was used for sampling each well and the flow-through cell was rinsed with deionzed water between each use.

PADEP Act 2 guidance requires that two rounds of groundwater data are needed to adequately characterize groundwater quality. In December 2010, to make sure that the proper number of samples were collected, ECCCD authorized MACTEC to collect samples from each of the preexisting shallow wells (MW-1 through MW-9) once for dissolved TAL metals, and to sample the new wells (MW-10, MW-11, and MW-12) twice for dissolved TAL metals and once for TCL VOCs and TCL SVOCS. This additional sampling is expected to be completed by the end of February 2011 and will be reported under separate cover.

During the November 2010 sampling event, one replicate sample was collected and analyzed and a trip blank for TCL VOC analysis accompanied each sample shipment containing VOC samples. Samples were either hand-delivered or shipped via overnight courier to TestAmerica following routine chain of custody procedures. A laboratory prepared trip blank accompanied each sample shipment containing samples for VOC analysis. Copies of chain of custody documentation are provided with the final analytical laboratory reports in Appendix B.

2.4 AQUIFER TESTING

MACTEC performed rising head "slug" tests at MW-3, MW-3D, MW-4, and MW-4D on November 1st and 2nd, 2010. The purpose of the slug test is to obtain groundwater recovery data used in calculating the estimated hydraulic conductivity of the aquifer in the immediate vicinity of the well.

The slug tests were performed using a disposable bailer (to quickly remove an approximately 1 liter "slug" of groundwater) along with a Mini-Troll pressure transducer connected to a Trimble Pocket PC data logger (to measure and record changes in groundwater level). First, the pressure transducer was lowered to approximately one foot above the bottom of the well. Second, the bailer was gently lowered until it was completely submerged. Once the water level had stabilized, as evidenced by stable water level readings shown on the data logger, the bailer was quickly withdrawn from the well. Groundwater recovery was measured and recorded by the Mini-Troll on a logarithmic time scale as shown on the data collection logs in Appendix C.

Multiple slug tests were completed at the wells on November 1, 2010, except MW-4D. Groundwater recovery at MW-4D was so slow that it had not recovered to static within 4 hours following removal of one bailer full of water on November 1st. Therefore, the test was repeated once on November 2nd, after the well had returned to a static level. Results of the slug tests are summarized in Section 3.1.

3.0 RESULTS

This section describes observations made during this Phase III ESA and presents aquifer testing results along with the analytical data.

3.1 SITE HYDROGEOLOGY & NAPL DELINEATION

Table 1 presents a summary of soil boring and well construction details, including the depth to bedrock and groundwater elevation measurements made during this Phase III ESA. Soil boring and well completion logs are included in Appendix A and the estimated hydraulic conductivity calculations made using the aquifer testing data are shown in Appendix C.

As reported in earlier reports and shown on the boring logs, the Site is comprised of "made" land, that is, buildable land made by placing fill materials into the bay over an approximate period from the mid-1800s through the 1970's. The natural, pre-development shoreline was likely located at the base of a step escarpment immediately south of the site in the area of what is now the Bayfront Parkway.

From the boring logs, the fill material falls into two general categories. The first is predominately brown silt with bricks, gravel, and some slag like material. This type of material was encountered in the southern portion of the Site (including and south of borings B-6 and B-8) as well as along the western perimeter of the Site (including borings B-12 and MW-3D). The southern borings B-6 and B-8 also contained some solidified tar like material with very little odor. That material was absent at B-12 and MW-3D, however, at those locations, roots and woody vegetation were observed in the subsurface.

The second general type of fill material that occupied the remainder of the Site (i.e., from borings B-10 north and B-12 east) contained varying amounts of shingles, tar paper, multi colored sand (brown, blue, red, and green) apparently used in making shingles, viscous tar like material, slag, sand, and gravel. In general, the amount of shingles and multi-colored sand observed increases to the north, whereas the mixture is more heterogeneous to the south as indicated on the logs for borings B-1 through B-4 and B-10. The shingle and tar paper material showed various degrees of weathering and compaction. In some locations it was loose and friable, whereas at others it was very compact and had the characteristics of dense clay. Observations regarding the occurrence and extent of the viscous tar like NAPL material are discussed further below in Section 3.1.1.

At most locations, the fill material was underlain by approximately 0.3 to 1.0 feet of fine sandy silt with some shell and root fragments, interpreted to be native material. At borings B-1, B-2, and B-3 the fill material extended to the top of bedrock and the native material was absent.

The depth to refusal (interpreted as the top of bedrock) elevation data is presented on Table 1 and that data was used to prepare the bedrock surface contour map shown on Figure 3. From Table 1, the depth to the top of bedrock ranges from approximately 7.2 ft-bgs at boring B-9 along the southern boundary of the Site to approximately 30 ft-bgs at the northern boundary (boring B-11). From Figure 3 it can be seen that the bedrock surface generally dips to the north. In the southern part of the Site the surface dips sharply north with a slope of approximately 0.05 feet/foot. The surface flattens to a slope of approximately 0.005 feet/foot in the central part of the Site between boring B-8 and monitoring well MW-9 and then dips sharply to the north again, with a slope of approximately 0.03 feet/foot between MW-9 and the northern Site boundary.

A review of Figure 3 reveals the following other noteworthy features:

1) Southeastern corner of the Site: The bedrock surface dips sharply to the east in this area which could be indicative of where the unnamed tributary flowed and discharged to the Bay prior to filling activities. The bedrock surface is approximately 8 to 10 feet below the bottom of the present unnamed creek along the northeastern Site boundary.

2) Eastern Site boundary: The bedrock surface dip has a more northeasterly direction (toward the Convention Center).

3) Central part of the Site: While the bedrock surface is relatively flat, some small depressions and mounds may exist as indicated by data from borings B-3, B-15 and B-13.

3.1.1 Aquifer Characteristics

Groundwater elevation data from November 2010 is presented on Table 1 and that data was used to prepare the groundwater contour map on Figure 4. The depth to groundwater at the Site ranges from approximately 2.17 ft-bgs at MW-7 to approximately 11.29 feet at MW-10.

The groundwater table occurs in the shallow wells within the unconsolidated fill material throughout the entire Site at elevations ranging from 580.19 ft-msl at MW-7 to 571.76 ft-msl at MW-10. According to data from NOAA's Erie PA Station ID 9063038 (www.http://tidesandcurrents.noaa.gov) the water level in the Bay at the time of groundwater measurements was approximately 570.50 ft-msl. From Figure 3, groundwater flow direction is generally north with components of flow to the northeast and northwest.

Groundwater elevation data from the only two wells completed within the upper bedrock at the site (MW-3D and MW-4D) is shown on Table 1. The water elevation in MW-3D was 571.66, which is 0.19 feet lower that its shallow counterpart MW-3 and the water elevation in MW-4D is 571.94 ft-msl, which is 0.81 feet lower than it shallow counterpart MW-4. Groundwater flow direction in the bedrock aquifer cannot be determined since only two bedrock wells exist, but it likely corresponds closely to flow direction in the overburden aquifer. Furthermore, the degree of hydraulic communication between the shallow overburden aquifer and the "bedrock" aquifer cannot be quantified with the existing data.

The Bay is the regional groundwater discharge feature. The extent to which the unnamed creek affects groundwater flow direction in the eastern part of the site is less clear. The creek is a man-made feature that was extended as the "made land" was extended into the Bay. As shown on Figure 3, the invert elevation where the tubed section of the creek daylights along Sassafras Street is 573 ft-msl, which is the same elevation as it is where the creek ultimately discharges to the Bay. Groundwater in the vicinity of the creek in November 2010 appeared to be at least 0.5 ft to 1.0 ft below the bottom of the creek. Observations of the creek in November revealed that there was no flow discharging overland to the Bay and some areas of standing water were observed.

The hydraulic conductivity was calculated using the rising head slug test data and the Bower and Rice Method (1976). Results of the rising head slug test and the calculations used to estimate the hydraulic conductivity are presented in Appendix C. In accordance with the testing methodology, approximately 1 liter of water was removed from the monitoring wells and recovery was monitored until nearly a static water level was achieved. At MW-3, groundwater recovery was very fast (less than four seconds). This response is at the practical limit of using a slug to determine hydraulic conductivity. As shown in Appendix C, the hydraulic conductivity of the unconsolidated formation at MW-3 is on the order, or higher, than approximately 5.5×10^{-2} centimeters per second (cm/sec). Testing was also conducted at MW-4, another shallow well. Three separate tests were conducted at that well. The calculated hydraulic conductivity values for tests from MW-4 were 9.0×10^{-4} cm/sec, 3.2×10^{-4} cm/sec, and 7.9×10^{-4} cm/sec, with an average estimated hydraulic conductivity calculated to be 6.7×10^{-4} cm/sec.

Slug tests were also conducted in two bedrock wells. Two tests were conducted at well MW-3D and one test was conducted at MW-4D. The estimated hydraulic conductivity calculated for bedrock well MW-3D was $7.5x10^{-4}$ cm/sec and $9.1x10^{-4}$ cm/sec with an average of $8.3x10^{-4}$ cm/sec. The calculated hydraulic conductivity at MW-4D was 3.1×10^{-6} cm/sec.

3.1.2 NAPL Delineation

Viscous DNAPL was known to exist in MW-5 prior to the Phase III. During November 2010, the DNAPL was observed from 7.4 ft-bgs (approximately 3 feet below the water table) to approximately 13 ft-bgs (the bottom of the well and top of bedrock). No other measurable NAPL was observed in any of the preexisting wells or newly constructed wells (MW-10, MW-11, MW-12, MW-3D, and MW-4D) during November 2010. However, some very viscous tar like material was observed on the water level probe at MW-8 and on sample tubing when it was retrieved from MW-2 and MW-11.

During completion of the soil borings during the Phase III ESA, NAPL was observed in the fill material from, at, or just below the water table, to refusal at borings B-1 through B-5, B-10, B-13, B14 (subsequently completed as MW-11), and B-15. NAPL was not observed in the bedrock surface material at any of those locations.

MACTEC considered NAPL to be present if a separate phase was clearly visible. The NAPL observed in the fill material at those locations mentioned above was in the form of viscous globules that produced a sheen and strong petroleum/naphthalene like odor. It must be noted that during completion of soil borings for this Phase III ESA throughout most of the Site, particularly in the north central portion, solidified tar and tar paper were observed. This material was not considered NAPL because it was not flowable under the field conditions and did not produce an observable separate phase.

Based on data from this and other studies at the site, MACTEC made an approximation of the extent of NAPL at the Site. The estimated boundary of NAPL is shown on Figure 3 (this is an estimate only and the actual extent of NAPL may be more or less). During drilling, MACTEC placed some of the material containing NAPL into jars of water to observe the phase separation. Those observations indicate that a certain fraction of the NAPL floats, while another fraction sinks. That observation, along with those that the NAPL was observed throughout the saturated zone at those boring locations identified above, leads MACTEC to refer to the material simply as NAPL.

3.2 SOIL AND DNAPL SAMPLE ANALYTICAL DATA

During this Phase III ESA, MACTEC collected samples of the fill material from boring locations B-6, B-7, B-8, and B-13 and had them analyzed for TCL VOCs, TCL SVOCs, PCBs, and TAL metals. Unsaturated zone samples from borings B-6, B-7, and B-8 were collected to assess conditions beneath the southern building slab. As stated in Section 3.1.2, NAPL was observed in saturated zone material from boring B-13. A sample was collected from that location to further assess possible future disposal options in the event that that material would ultimately be excavated for off-Site disposal. For this reason, data from B-13 is discussed separately from B-6, B-7 and B-8 data below.

Table 2 presents the TAL metals data and a summary of detected TCL VOCs and TCL SVOCs. None of the samples contained detectable concentrations of PCBs and are therefore not shown on Table 2. Table 2 also presents the PADEP Residential Statewide Health Standard Medium Specific Concentration (MSC) values for direct contact and soil-to-groundwater values for Used Aquifers less than 2,500 mg/L total dissolved solids (TDS) that became effective January 8, 2011. Sample results were screened against Residential, Used Aquifer MSCs because possible future use of the Site could include a residential component. Even though the City of Erie passed an ordinance that prohibits the use of groundwater for drinking or agricultural purposes within the entire City of Erie, results were screened against Used Aquifer MSCs to be conservative because groundwater discharges to the Bay. Copies of the final analytical data reports from TestAmerica are provided in Appendix B. Figure 5 contains a summary of soil sample results that exceed MSCs.

In addition to the analyses identified above, MACTEC collected one sample of saturated zone fill material containing NAPL from boring B-1 and one sample of the DNAPL from MW-5. The soil samples was analyzed using the TCLP for the hazardous waste characterization analytes including TCLP VOCs, TCLP SVOCs, TCLP metals, reactive cyanide, reactive sulfide, ignitability, and corrosivity. The DNAPL sample was also submitted for waste characterization analysis (petroleum products cannot be extracted by USEPA SW-846 Method 1311 and are analyzed directly for VOCs, SVOCs and metals by USEPA SW-846 Methods 8260, 8270 and 6010/7471, respectively). Table 3 presents a summary of the waste characterization data along with the respective regulatory criteria. Copies of the final analytical data reports from TestAmerica are provided in Appendix B.

None of the samples collected from B-6, B-7, and B-8 contained concentration of TCL VOCs that exceeded MSCs. However, various TCL SVOCs were detected in each of those samples and the following concentrations exceeded their respective MSCs:

- Benzo(a)antrhracene (MSC 5,700 ug/Kg): B-7-0204 (8,300 ug/Kg)
- Benzo(a)pyrene (MSC 570 ug/Kg): B-6-0406 (3,900 ug/kg) and B-7-0204 (9,100 ug/Kg).
- Benzo(b)fluoranthene (MSC 5,700 ug/Kg): B-7-0204 (13,000 ug/Kg)
- Dibenz(a,h)anthracene (MSC 570 ug/Kg): B-6-0406 (790 ug/Kg) and B-7-0204 (2,000 ug/Kg)

Arsenic was the only metal detected in a concentration exceeding the MSC (12 mg/Kg). Sample B-6-0406 contained 12.7 mg/kg and sample B-8-0002 contained 47 mg/kg of arsenic.

Sample B-13-1214 was a saturated zone sample that contained observable NAPL during drilling. Elevated concentrations of TCL VOCs and TCL SVOCs were detected in that sample relative to samples collected from B-6, B-7, and B-8 (Table 2). Note that the soil to groundwater MSCs that apply to sample B-13-1214 are different from those that apply to those samples from B-6, B-7 and B-8 (Table 2). The reason for this is that B-13-1214 was a saturated sample and 25PA Code 250.308(a) requires that the soil to groundwater MSC for a saturated sample be the greater of either the 100X the groundwater MSC or 1/10 of the Generic Value published on the tables in Appendix A of that regulation.

TCL VOCs that were detected in concentrations exceeding a PADEP Residential Used Aquifer MSC in sample B13-1214 were benzene (22,000 ug/kg, estimated), ethylbenzene (390,000 ug/kg), and isopropylbenzene (85,000 ug/kg). The MSCs for those compounds are 500 ug/kg, 70,000 ug/kg, and 84,000 ug/kg, respectively.

Sample B13-1214 contained the following SVOCs that exceed the respective PADEP Residential Used Aquifer MSCs shown on Table 2: 1,1-Biphenyl, 2-Methylnaphthalene, 4-Nitroaniline, Acenaphthene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Carbazole, Chrysene, Dibenz(a,h)anthracene, Dibenzfuran, Fluoranthene, Fluorene, Indeno(1,2,3-cd)pyrene, Naphthalene, Phenanthrene, and Pyrene. The metals concentrations observed in sample B13-1214 that exceed a PADEP residential MSC are arsenic, chromium (assuming it to be hexavalent chrome to be conservative), cobalt, and lead.

As shown on Table 3, none of the concentrations detected in the waste characterization sample B-1-0708 exceeded the TCLP limits. The sample of DNAPL from MW-5 contained 31 mg/kg benzene. The results of a petroleum product sample are not directly comparable to TCLP limits.

TestAmerica provided Level IV data reports for each of the soil samples, which includes all the raw laboratory data, data summaries, and supporting QA/QC data. Evaluation of all of the data indicates that the data has been reported and qualified appropriately and no issues were identified that affect the usability of the data.

3.3 GROUNDWATER ANALYTICAL DATA

Table 4 presents a "hits only" summary of the detected VOC and SVOC groundwater data from samples collected during November 2010 along with the Residential Used Aquifer MSCs that became effective January 8, 2011. Even though the City of Erie passed an ordinance that prohibits the use of groundwater for drinking or agricultural purposes within the entire City of Erie, results were screened against used aquifer MSCs to be conservative because groundwater discharges to the Bay. The final analytical data reports from TestAmerica are included in Appendix C. Figure 5 contains a summary of groundwater sample results that exceed MSCs.

As shown on Table 4, various VOCs were detected in each of the groundwater samples. Three VOCs were detected in concentrations that exceed their respective Residential Used Aquifer MSCs. These are:

- 1,1-Dichloroethane (MSC 31ug/L): MW-5 (53 ug/L, estimated);
- Benzene (MSC 5 ug/L): MW-5 (500 ug/L), MW-6 (16 ug/L), MW-8 (6.3 ug/L, estimated), and MW-11 (7.5 ug/L, estimated); and
- Methylene Chloride (MSC of 5 ug/L): MW-5 (51 ug/L, estimated).

The benzene concentration observed in the sample from MW-6 is the only VOC exceeding an MSC that has been detected in a sample from a well outside of the area where NAPL has been observed or is suspected.

The SVOC data shown on Table 4 indicates that numerous SVOCs are present in the groundwater sample from MW-5 in concentrations that exceed the Residential Used Aquifer MSCs. The results from the sample from MW-5 are consistent with the fact that measurable DNAPL is present in that well. Samples

from wells MW-8, MW-11, and MW-12 also contained various SVOCs that exceed an MSC. The SVOCs detected include: 2,4-Dimethylphenol, 2-Methylnaphthalene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(ghi)perylene, Benzo)k)fluoranthene, Carbazole, Chrysene, Dibenzo(a,h)anthracene, Dibenzofuran, Fluoranthene, Indeno(1,2,3-cd)pyrene, Naphthalene, Phenanthrene, and Pyrene.

TestAmerica provided Level IV data reports for each of the groundwater samples, which includes all the raw laboratory data, data summaries and supporting QA/QC data. Evaluation of all of the data indicates that the data has been reported and qualified appropriately and no issues were identified that affect the usability of the data.

4.0 SUMMARY

MACTEC has completed a Phase III Environmental Site Assessment (ESA) at the former GAF Building Materials Manufacturing Corporation, Inc. (GAF) Facility (Site) located at 218 Bayfront Parkway in the City of Erie Pennsylvania. To achieve the objective of the investigation, MACTEC:

1) Completed 21 soil borings and collected four soil samples for analytical and geotechnical analyses;
2) Installed two upper bedrock and three shallow overburden groundwater monitoring wells;
3) Gauged each well to determine the existence of non-aqueous phase liquids (NAPL); and
4) Collected groundwater and NAPL samples for laboratory analyses.

Following are some of the key findings from this investigations:

- Various organic and inorganic analytes are present in soil and groundwater at concentrations that exceed the PADEP Act 2 Residential, Used Aquifer Statewide Health Standard, particularly in the area where NAPL has been observed or is suspected.

- Bedrock surface generally dips to the north. In the southern part of the Site the surface dips sharply north with a slope of approximately 0.05 feet/foot. The surface flattens to a slope of approximately 0.005 feet/foot in the central part of the Site between boring B-8 and monitoring well MW-9 and then dips sharply to the north again, with a slope of approximately 0.03 feet/foot between MW-9 and the northern Site boundary.

- Groundwater flow is towards the north, with components of flow to the northeast and northwest.

- The average hydraulic conductivity calculated in the shallow unconsolidated formation ranges from at least (or greater than) 5.5×10^{-2} at MW-3 to 6.7×10^{-4} cm/sec at MW-4. The estimated hydraulic conductivity of the bedrock wells was 8.3×10^{-4} cm/sec in MW-3D and 3.1×10^{-6} cm/sec in MW-4D.

- The estimated boundary of NAPL is shown on Figure 3. During drilling, MACTEC placed some of the material containing NAPL into jars of water to observe the phase separation. Those observations indicate that a certain fraction of the NAPL floats, while another fraction sinks.

Notes:
1) PADEP Residential Direct Contact and Soil to Groundwater (Used Aquifer) MSCs from January 2011. Yellow higlight indicates an exceedance of those values.
2) Applies to sample B-13-1214 only because it was collected from below the water table. Per 25PACode 250.308, value shown is the greater of either 1/10th Generic Soil to Groundwater MSC or 100 X groundwater MSC. Green highlight indicates an exceedance of those values.
3) "J" Indicates that analyte was detected in blank; "U" indicates the analyte not detected in a concentration exceeding the laboratory reporting limit; and B indicates an estimated concentration.
4)" --" indicates that no MSC has been promulgated.
5) "*"indicates that MSCs are for hexavalent chromium.

Project Manager

November 15, 2010

NELAC REPORTING:

At the time of analysis the laboratory was in compliance with the current NELAC standards and held accreditation for all analyses performed unless noted by a qualifier. The labs accreditation numbers are listed below. The format and contents of the report meets all applicable NELAC standards except as noted in the narrative and shall not be reproduced except in full, without the written approval of the laboratory. The table below presents a summary of the certifications held by TestAmerica Pittsburgh. Our primary accreditation authority for the Non-potable water and Solid & Hazardous waste programs is Pennsylvania DEP. A more detailed parameter list is available upon request. Please ask your project manager for this information when required.

Certifying State/Program	Certificate #	Program Types	TestAmerica
DoD ELAP	ADE-1442	WW HW	X
US Dept of Agriculture	(#P330-10-00139)	Foreign Soil Import Permit	X
Arkansas	(#88-0690)	WW HW	X X
California – NELAC	04224CA	WW HW	X X
Connecticut	(#PH-0688)	WW HW	X X
Florida – NELAC	(#E871008)	WW HW	X X
Illinois – NELAC	(#002319)	WW HW	X X
Kansas – NELAC	(#E-10350)	WW HW	X X
Louisiana – NELAC	(#04041)	WW HW	X X
New Hampshire – NELAC	(#203010)	WW --	X --
New Jersey – NELAC	(PA-005)	WW HW	X X
New York – NELAC	(#11182)	WW HW	X X
North Carolina	(#434)	WW HW	X X
Pennsylvania - NELAC	(#02-00416)	WW HW	X X
South Carolina	(#89014002)	WW HW	X X
Utah – NELAC	(STLP)	WW HW	X X
West Virginia	(#142)	WW HW	X X
Wisconsin	998027800	WW HW	X X

The codes utilized for program types are described below:

HW Hazardous Waste certification
WW Non-potable Water and/or Wastewater certification
X Laboratory has some form of certification under the specific program. Many states certify laboratories for specific parameters or tests within a category. The information in the table indicates the lab is certified in a general category of testing. Please contact the laboratory if parameter specific certification information is required.

Updated: 05/19/10 N:\Reporting\NELAC NARRATIVE Pttsburgh_Updated 051910.doc

CASE NARRATIVE

Mactec Engineering & Consulting
Lot #: C0J250457

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on October 23, 2010. The cooler was received within the proper temperature range.

A 250 ml glass jar was received broken for sample B1-0708; this sample aliquot was transferred to a new jar and used for analysis.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "J" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "B" qualifier.

TCLP GC/MS Volatiles:
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected, several samples were analyzed at dilutions.

GC/MS Semivolatiles cont.:
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

TCLP GC/MS Semivolatiles:
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

PCBs:
Continuing calibration standard Y1100062 did not meet the 15%D criteria. The samples were analyzed twice with the continuing calibration standard not meeting criteria. Only one set of data is reported.

Metals:
Sample B6-0406 was analyzed at dilution for all requested 6010 analytes except cobalt, nickel, lead, and thallium. These analytes are reported from the 6500ICP, for which an internal standards, indium and yttrium, are added to all standards and samples during analysis. The yttrium counts in these samples were outside of QC criteria (70-130% of the yttrium counts in the ICB), therefore, all analytes referencing yttrium were diluted for analysis.

The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

TCLP Metals:
The TCLP leachate blank had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier.

TCLP Metals cont.:
The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

General Chemistry:
The ignitability, total cyanide, and the sulfide analyses were done outside of the holding time as per the client.

The test for pH is a field parameter. The laboratory pH analysis was completed at the request of the client.

The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

METHODS SUMMARY

C0J250457

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Cyanide, Total	SW846 9012A	SW846 9012A
Ignitability	SW846 SECTION 7	SW846 SECTION 7
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A	SW846 1311/7470

SAMPLE SUMMARY

C0J250457

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
L8240	001	B1-0708	10/21/10	14:00
L8241	002	B7-0204	10/22/10	12:45
L8243	003	B6-0406	10/22/10	11:20
L8244	004	B8-0002	10/22/10	13:40
L8245	005	TRIP BLANK	10/22/10	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

SW846 8082 METHOD BLANK SUMMARY

BLANK WORKORDER NO.: L87KA1AA

Lab Name: TestAmerica Laboratories, Inc.

Lab Code: TALPIT

SDG Number:

Lab File ID: Y1100076.

Lot Number: C0J250457

Matrix: SOLID

Extraction Method: 3541

Date Extracted: 10/28/10

Date Analyzed(1): 11/03/10

Date Analyzed(2): N/A

Time Analyzed(1): 04:03

Time Analyzed(2): N/A

Instrument ID(1): S/T

Instrument ID(2): N/A

GC Column(1): MR1/MR2 ID: 053 GC Column(2): N/A ID: N/A

THIS METHOD BLANK APPLIES TO THE FOLLOWING SAMPLES, MS, AND MSD:

	CLIENT ID.	SAMPLE WORK ORDER #	DATE ANALYZED(1)	DATE ANALYZED(2)
01	INTRA-LAB QC	L80RK1AD	11/02/10	N/A

Level 1 Review Checklist for Organic Extractions

Lot Number(s) COJ250457, -270440, -270469, -270577, -270511

QC Batch P030110

Sample Preparation	Yes	No	N/A
1) Was all sample preparation documentation completed and reviewed?	✓		
2) Where applicable were special instructions followed and copies attached?			✓
3) Were samples weighed and measured to the appropriate number of significant figures?	✓		

Documentation	Yes	No	N/A
1) Were method deviations approved and documented in Clouseau?			✓
2) Is all paperwork completed including analyst's signature and date?	✓		
3) Is copy of extraction log to be in the documentation placed in the folder?	✓		
4) Are all sample vials clearly and accurately labeled?	✓		
5) Is all paperwork complete?	✓		

QC Data	Yes	No	N/A
1) Is a prep blank extracted with every batch of samples?	✓		
2) Has the temperature of the room been documented on the prep sheet?	✓		
3) Was the pressure checked on all vessels?	✓		
4) Were samples extracted at reduced volume due to insufficient sample? If so, document in Clouseau.			✓
5) Were holding time violations documented in Clouseau?			✓

Processing Host: PITPC-502

Concentration Formula: Amt * DF * Uf * Vt/(Vi * Ws)*gpc * CpndVariable

Name	Value	Description
DF	1.000	Dilution Factor
Uf	1.000	ng unit correction factor
Vt	5000.000	Volume of final extract (uL)(1000 low, 2
Vi	2.000	Volume injected (uL)
Ws	15.200	Weight of sample extracted (g)
gpc	1.000	gpc correction factor
Cpnd Variable		Local Compound Variable

	Compounds	QUANT SIG MASS	RT	EXP RT	REL RT	RESPONSE	CONCENTRATIONS ON-COLUMN (NG)	CONCENTRATIONS FINAL (ug/kg)

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
H - Operator selected an alternate compound hit.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
H - Operator selected an alternate compound hit.

Data File Name: F09020C5.D
Inj. Date and Time: 02-SEP-2010 03:01

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
