NELAC REPORTING:

At the time of analysis the laboratory was in compliance with the current NELAC standards and held accreditation for all analyses performed unless noted by a qualifier. The labs accreditation numbers are listed below. The format and contents of the report meets all applicable NELAC standards except as noted in the narrative and shall not be reproduced except in full, without the written approval of the laboratory. The table below presents a summary of the certifications held by TestAmerica Pittsburgh. Our primary accreditation authority for the Non-potable water and Solid & Hazardous waste programs is Pennsylvania DEP. A more detailed parameter list is available upon request. Please ask your project manager for this information when required.

CASE NARRATIVE

Mactec Engineering & Consulting
Lot #: C0K020532

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on October 30, 2010. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
Due to the concentration of target compounds detected, sample B-13-1214 was analyzed at a dilution.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The continuing calibrations had compounds >25%D but they were within expected performance range for the compounds. All results were reported.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected, sample B-13-1214 was analyzed at two dilutions. Both analyses had the surrogates diluted out. Both sets of data are reported.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The continuing calibrations had compounds >25%D but they were within expected performance range for the compounds. All results were reported.

PCBs:
Sample B-13-1214 was analyzed at a dilution due to matrix. This sample had the surrogates diluted out.

CASE NARRATIVE

Mactec Engineering & Consulting
Lot #: C0K020532

Metals:
The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

The method blank had iron and zinc detected above the reporting limit. The iron and zinc results in the sample were the concentration of iron and zinc detected in the method blank. All data was reported.

General Chemistry:
There were no problems associated with the analysis.
