NELAC REPORTING:

At the time of analysis the laboratory was in compliance with the current NELAC standards and held accreditation for all analyses performed unless noted by a qualifier. The labs accreditation numbers are listed below. The format and contents of the report meets all applicable NELAC standards except as noted in the narrative and shall not be reproduced except in full, without the written approval of the laboratory. The table below presents a summary of the certifications held by TestAmerica Pittsburgh. Our primary accreditation authority for the Non-potable water and Solid & Hazardous waste programs is Pennsylvania DEP. A more detailed parameter list is available upon request. Please ask your project manager for this information when required.

The codes utilized for program types are described below:

HW Hazardous Waste certification
WW Non-potable Water and/or Wastewater certification
X Laboratory has some form of certification under the specific program. Many states certify laboratories for specific parameters or tests within a category. The information in the table indicates the lab is certified in a general category of testing. Please contact the laboratory if parameter specific certification information is required.

CASE NARRATIVE

Mactec Engineering & Consulting
Lot #: C0K120577

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on November 11, and 12, 2010. The coolers were received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected and/or matrix, samples MW-11 and MW-12-1110 were analyzed at a dilution.

Sample MW-11 had the surrogates diluted out.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

Several continuing calibration standards had compounds with a %D >25%; but were within the expected performance range for these compounds.

AQUIFER TESTING RESULTS

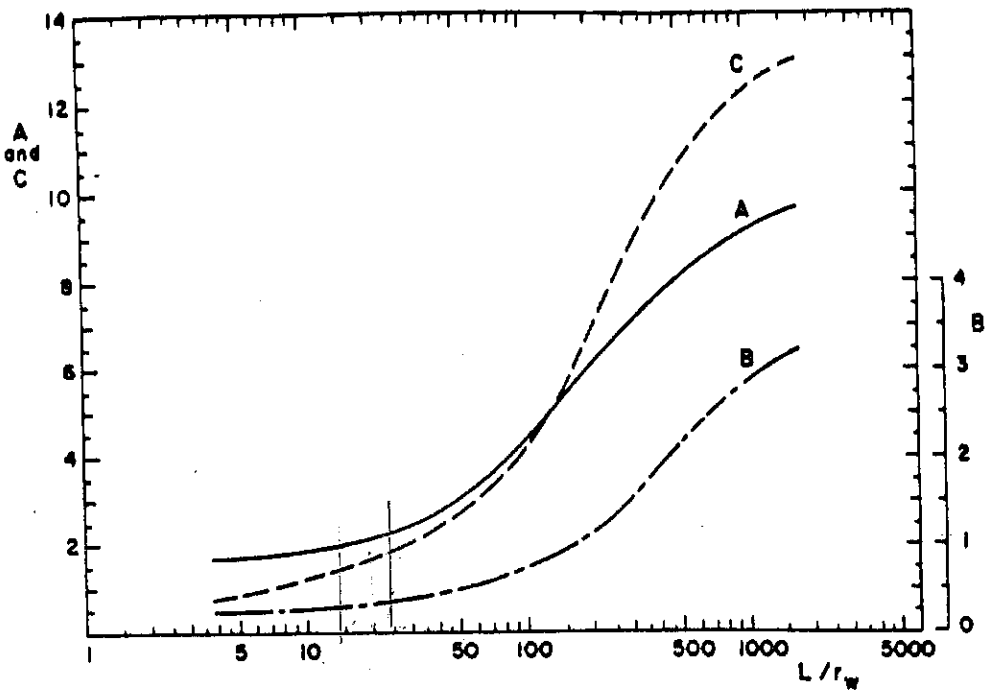
GAF Phase III ESA
Slug Test Methods and Calculations

The slug tests were performed using a disposable bailer to quickly remove a "slug" of groundwater along with a Mini-Troll pressure transducer connected to a Trimble Pocket PC data logger (to measure and record changes in groundwater level). First, the pressure transducer was lowered to approximately one foot above the bottom of the well. Second, the bailer was gently lowered until it was completely submerged. Once the water level had stabilized, as evidenced by stable water level readings shown on the data logger, the bailer (approximately 1L of water) was quickly withdrawn from the well. Groundwater recovery was measured and recorded by the Mini-Troll on a logarithmic time scale.

The slug test data were reduced and the estimated hydraulic conductivity was calculated on the accompanying pages using the Bower and Rice Method published in "A Slug Test for Determining Hydraulic Conductivity of Unconfined Aquifers with Completely of Partially Penetrating Wells", Water Resources Research, Vol 12. #3, 1976.



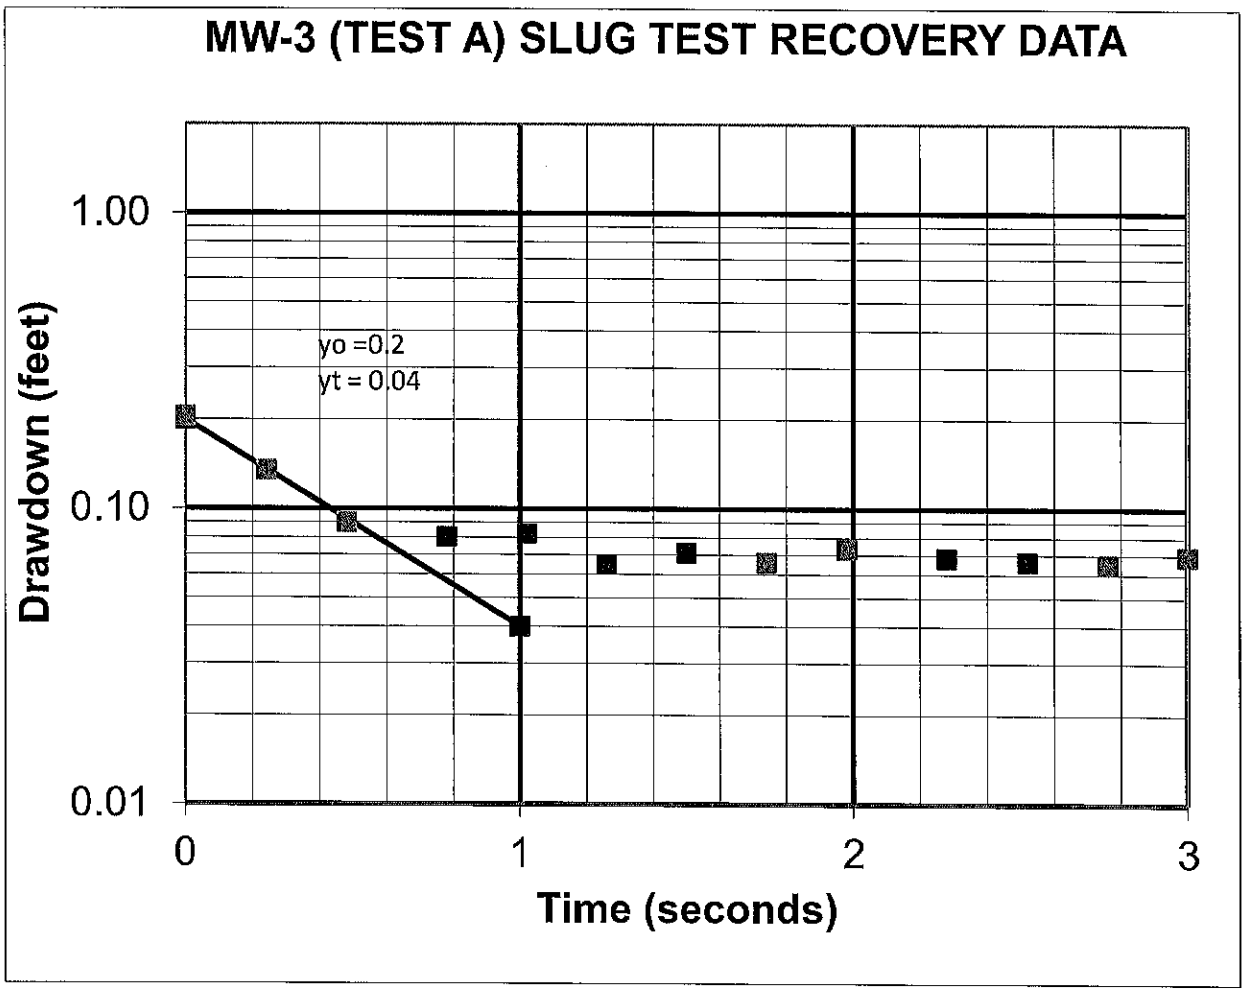
From that, the following equation has been used to calculate hydraulic conductivity:

$$K = \frac{r_c^2 * \ln\left(\frac{R_e}{r_w}\right)}{2L} * \frac{1}{t} * \ln\left(\frac{Y_o}{Y_t}\right)$$

Where:

$$\ln\left(\frac{R_e}{r_w}\right) = \left[\frac{1.1}{\ln\left(\frac{H}{r_w}\right)} + \frac{A + B * \ln\left[\frac{D-H}{r_w}\right]}{\frac{L}{r_w}}\right]^{-1}$$

r_c= casing radius
L= length of intake
r_w= radial distance between undisturbed aquifer and well center
R_e= effective radius of well
Y_o= initial drawdown
Y_t= vertical distance between the water level in well at time t and equilibrium level
H= distance from water table to the bottom of intake
D= saturated aquifer thickness
A and B= dimensionless coefficients that are a function of $\frac{L}{r_w}$; shown on the attached nomogram.



Curves relating coefficients A, B, and C to L/r_w.
